

Readme: Visual Inference and Graphical Representation in Regression Discontinuity Designs

January 31, 2023

1 Overview

This replication package requires several different packages for Stata and R, and also uses one MATLAB file. Software versions used are noted below. We are aware of two software packages where using later versions may change output. For `rdrobust`, different versions from what we use may produce slightly different point estimates (in our testing, this did not impact the subsequent analyses, figures, or tables at all), and we include a copy of the version of `rdrobust` used (7.3.0), as this version predates the package's releases with version control on GitHub. For `RDHonest`, later versions of the package expect data in a different format, and the relevant R program provides the appropriate command to install the version we used from GitHub through the `devtools` package. We provide all data files produced by the build portion of the script, should users wish to focus on the analysis portion.

To run the replication package, see the `rd_graph_main.do` file in the root directory. Update the specified directories in the header to match your computing environment. Install any required software. Note that if running the build portion of the package, there are one Mathematica and two R scripts referenced in `rd_graph_main.do`, which must be run manually at the appropriate times.

The notes below document each figure and table in the paper and how it is produced, except for non-statistical output, such as example graphs and screenshots of our experiment.

Data files (found in the data folder) are self-documented with Stata's variable labels. The Pilot and Phase folders contain results from non-expert

trials, and the Expert folders contain results from the corresponding expert trials (see the Experiment Notes section of the readme and the documentation in the full paper and its appendices for additional information). `rd_estimates_micro.dta` contains all econometric inferences and estimates.

The `data/DGP` folder contains the 11 DGP specifications and transformed running variables. The `simulated_data` folder contains the actual simulated datasets from the DGPs used in the graphical trials and on which the different econometric inference procedures are conducted.

On the computing environment used (a shared research computing server with many Intel Xeon E5-4669 CPUs), the build portion of the script runs in approximately three hours. The analysis portion of the script is much faster at under 15 minutes. RAM requirements are minimal.

See the Tables and Figures sections below for information on where and how each table and figure is generated.

2 Software Versions Used

Stata (17.0 2022-06-01)

- `rddrobust` 7.3.0 (included in `rddrobust` folder)
- `grclleg` 1.0.5
- `estout` 3.30
- `sepscatter` 1.1.0
- `onewayplot` 2.1.3
- `moremata` 1.0.1/9.2
- `car-stata` 1.0.0
- `cgmreg` 3.0.0
- `rdmse` 2.0

R (4.2.0)

- `RDHonest` 0.3.2 (we provide the appropriate command to install this version from GitHub with the `devtools` package)
- `zipfR` 0.6-70

- Hmisc 4.5-0
- haven 2.4.1
- foreign 0.8-82
- dplyr 1.0.6
- tidyverse 1.3.1
- devtools 2.4.1

Mathematica (12.3.1.0)

3 Experiment Notes

Player treatment group labels (see Table 1 in paper for additional notes)

Phase I (Pilot 1.0) (Phase 1)

Binwidth x Scaling

- A Small bins, normal scale
- B Big bins, normal scale
- C Small bins, big scale
- D Big bins, big scale

Phase II (Phase 2)

Binwidth x spacing

- A Small bins, ES
- B Big bins, ES
- C Small bins, QS
- D Big bins, QS

Phase III (Phase 3)

Smoothed fit lines (nofit/yesfit for included/excluded) x Vertical line at the policy threshold (yesline/noline for included/excluded)

- A nofit, yesline
- B yesfit, yesline
- C nofit, noline

Phase VI (Phase 4)

Binwidth x Fit

- A Small bins, no fit
- B Big bins, no fit
- C Small bins, yes fit
- D Big bins, yes fit

Phase VII (Phase 5)

- A DGP fit by global polynomial, homoskedastic noise term
- B DGP fit by local polynomial, homoskedastic noise term
- C DGP fit by global polynomial, heteroskedastic noise term
- D DGP fit by local polynomial, heteroskedastic noise term

Experts (Except QSS)

- A Vertical line at treatment threshold, no fit lines, small bins, default axis scaling, even spacing

Experts QSS

- B: Vertical line at treatment threshold, no fit lines, big bins, default axis scaling, even spacing
